question 13

Reading the data file into R (I messed up here and did not realize I should have been reading this file in as a “read.table”, I was using “read.csv” and spent the past 2 days trying to figure out how to get this working. I watched the video all the way through and saw my mistake. I feel silly!)

```
orm <- read.table("rs8067378_ENSG00000172057.6.txt")
head(orm)
```

```
##      sample geno      exp
## 1 HG00367  A/G 28.96038
## 2 NA20768  A/G 20.24449
## 3 HG00361  A/A 31.32628
## 4 HG00135  A/A 34.11169
## 5 NA18870  G/G 18.25141
## 6 NA11993  A/A 32.89721
```

It worked, great! I’ve been having trouble with that recently. Time to determine the sample sizes for each genotype;

```
table(orm$geno)
```

```
##
## A/A A/G G/G
## 108 233 121
```

Ok, sweet that works! I remembered this from today’s lab 13 (which is after, but it’s still cool that I remember). Time for median;

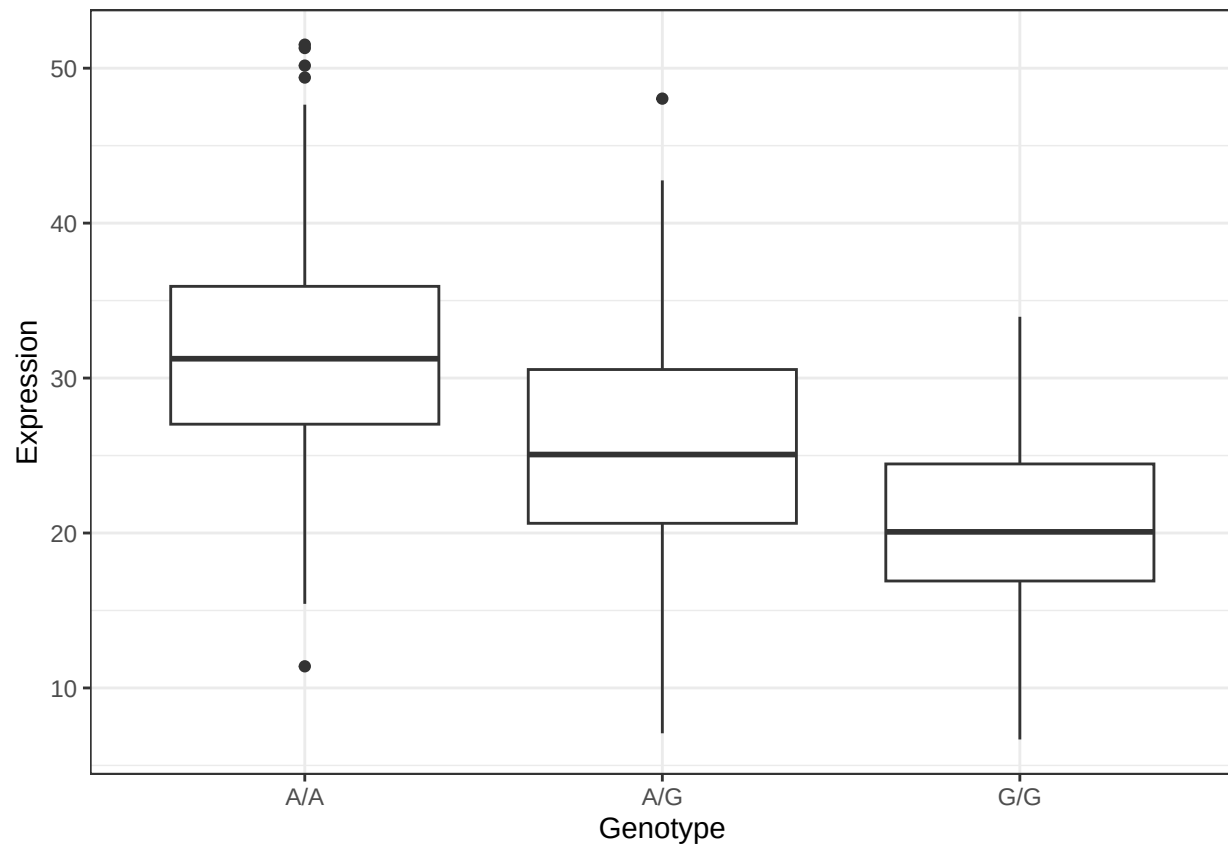

```
tapply(orm$exp, orm$geno, median)
```

```
##      A/A      A/G      G/G
## 31.24847 25.06486 20.07363
```

Question 14: Boxplot

```
library(ggplot2)

ggplot(orm)+
  aes(geno, exp)+
  geom_boxplot()+
  labs(x= "Genotype", y= "Expression")+
  theme_bw()
```

I read that this does not need to be flashy, I am tired and have spent a long time just trying to open the file correctly! But this is cute none-the-less!
